

Mini USB Plus

MK-III

USB Duplicator Quick Start Guide

Power Jack
Power Switch

Source Port

Power LED

1

Plug in the power and turn on power switch to confirm that the blue power LED is steady on.

2

Insert the flash drive with the data to be copied into the source port. When the green light is on, the machine has detected it. When the green light flashes, it indicates that it starts working.

3

Insert the blank drive into the target ports. When the green light is on, the machine has detected it. When the green light flashes, it starts to copy automatically.

4

When the green light of the target ports is steady, indicating that the copying process has been completed, you can immediately unplug the copied drive and insert the next blank one for copying, without waiting for all the drives to complete and then change to the next round.

⚠ The Mini USB Plus MK-III is a fairly light weight and portable USB duplicator. With unique unsynchronized plug-and-copy mode, you don't have to wait for all the flash drives to be copied, and any of them can be replaced with another one after copy, allowing you to complete the copy quickly and easily. In addition, the duplicator copies valid data section only, and does not need to copy the whole drive, which can greatly reduce your precious time.

⚠Warning

1. **DO NOT** unplug USB from duplicator during the execution process. It may cause damage to the duplicator system and USB.

2. **DO NOT** plug in USB before the machine is powered on and boots up. Certain disqualified USB may cause problem to system boot up.
